CORRECTED APPEAL BRIEF

Siri

Appellants herewith respectfully present a corrected Summary of the Claimed Subject Matter and a corrected Grounds of Rejection to Be Reviewed on Appeal of the Brief on Appeal, responsive to the Notice of Non-Compliant Appeal Brief mailed on March 19, 2007, related to a Brief on Appeal that was submitted on July 27, 2006.

Patent
Serial No. 09/801,080
Corrected Appeal Brief in Reply to
Notice of Non-Compliant Appeal Brief mailed on March 19, 2007

Please delete the originally submitted Summary of the Claimed Subject Matter and Grounds of Rejection to Be Reviewed on Appeal and substitute the Summary of the Claimed Subject Matter and Grounds of Rejection to Be Reviewed on Appeal included herein.

SUMMARY OF THE CLAIMED SUBJECT MATTER

The present system, for example as claimed in claim 1, relates to a data processing device (e.g., see, FIG. 1 and the accompanying description on page 5, lines 10-11) including a master controller (1); a first functional unit (2) including a slave controller (20); a second functional unit (3); and a common memory (11) shared by the first and second functional units (e.g., see, page 5, lines 10-13). The data processing device is programmed to execute an instruction by the first functional unit involving input/output operations by the first functional unit (e.g., see, page 5, lines 14-16). Execution by the data processing device involves at least one of: output data of the first functional unit being processed by the second functional unit during execution of the instruction (e.g., see, page 5, lines 16-17), and the input data to the first functional unit being generated by the second functional unit during execution of the instruction (e.g., see, page 5, lines 17-18).

The present method, for example as claimed in claim 4, recites limitations similar in pertinent part as previously discussed regarding claim 1 with the addition of the first functional unit (2) (e.g., see, FIG. 1) being arranged for executing instructions corresponding to operations having a relatively long latency (e.g., see, page 5, lines 20-22) and the second functional unit (3) being capable of executing instructions corresponding to operations having a relatively short latency (e.g., see, page 5, lines 22-24).

An example of such a device and method is provided more particularly in the present specification in FIGS. 5 and 6B and the accompanying description at page 10, line 27, to page 11, line 19. In Figure 6b, inputs are not presented simultaneously, nor are outputs presented simultaneously. The input $i_1 (= p + q)$ is presented to the complex functional unit as soon as it is available, in cycle 1. During cycles 1 and 2, the second input $i_2 (= p - q - 2)$ is prepared and is then presented to the complex functional unit in cycle 3. Also in cycle 3, the first output $o_1 (= 2*i_2 + 3)$ is presented. During cycles 3, 4 and 5, the output $o_2 (= 5*i_1 + 2*i_2 + 1)$ is computed and presented. During cycles 4 and 5,

o1 (previously made available in cycle 3) is squared and the value 100 is subtracted to form a partial result as part of the condition checking in the last statement of Figure 5. In cycles 6 and 7, o1 is squared and the resulting quantity added to the partial result. Finally, in cycle 8, the inequality is evaluated.

In this example, it may be seen that output data (e.g., o1) of the complex functional unit ("first functional unit") is processed by the other functional unit ("second functional unit") during execution of the instruction (e.g., 2Dtransform) by the complex functional unit ("first functional unit") as recited in claims 1 and 4. Also, input data (e.g., i2) to the first functional unit is generated by the second functional unit during execution of the instruction as recited in claims 1 and 4.

It should be explicitly noted that it is not the Appellants' intention that the currently claimed device and method be limited to operation within this illustrative device and method beyond what is required by the claim language. Description of the illustrative device and method is provided indicating portions of the claims which cover the illustrative device and method merely for

Patent

Corrected Appeal Brief in Reply to

Notice of Non-Compliant Appeal Brief mailed on March 19, 2007

compliance with requirements of this appeal without intending any further interpreted limitations be read into the claims as presented.

GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

Whether Claims 1-5 of U.S. Patent Application Serial No. 09/801,080 are anticipated under 35 U.S.C. §102(b) over U.S. Patent No. 4,876,643 to McNeill ("McNeill") and whether Claims 5-7 of U.S. Patent Application Serial No. 09/801,080 are anticipated under 35 U.S.C. §102(e) over U.S. Patent No. 6,266,766 to O'Connor ("O'Connor"). The Appellants respectfully wish the Board to address the patentability of independent Claims 1 and 4, and further Claims 2, 3, and 5, as depending on one of Claims 1 and 4, based on the requirements of Claim 1. This position is provided for the specific and stated purpose of simplifying the current issue on appeal. However, the Appellants herein specifically wish to reserve the right to argue and address the patentability of each of the further claims at a later date should the separately patentable subject matter of those claims later become an issue. Accordingly, this limitation of the subject matter presented for appeal herein, specifically limited to discussions of the patentability of Claim 1, is not intended as a waiver of

Appellants' right to argue the patentability of the further claims and claim elements at that later time.

CONCLUSION

In view of the above, it is respectfully submitted that the Brief on Appeal is compliant and consideration on the merits is respectfully requested.

Respectfully submitted,

By
